

ASNT5173-PQC is available on two evaluation boards: one with negative supply and one with positive supply. Application notes for these two evaluation boards are presented in order of:

- Negative supply on ASNT05_12
- Positive supply on ASNT05_11

By default, ADSANTEC will ship the positive supply evaluation board. Please send us a message through the DigiKey marketplace website if you would like to receive the negative supply version.

The datasheet for ASNT5173-PQC can be accessed through the following <u>LINK</u>.

ASNT5173-PQC on ASNT05_12 Evaluation Board DC-17*Gbps*/13*GHz* Signal Phase Shifter with Amplitude Control Application Note

Part Description

The ASNT5173-PQC phase shifter accepts a data or clock signal at its differential input port ip/in and delivers the signal's copy with a controlled phase delay to its differential output port outp/outn. The delay can be adjusted by DC or AC signals applied to the differential tuning port icntp/icntn. The output amplitude can be adjusted by DC signals applied to the differential tuning port tnp/tnn.

The part is mounted on an ASNT05_12 evaluation board with 50*Ohm* transmission lines to transfer signals from the chip to 4 high-speed edge-mount female connectors (Southwest or similar) as shown in Fig. 1. The board has four low-speed edge-mount SMA connectors for control signals, a MOLEX connector for the power supply, as well as signal filters, supply filters, and decoupling networks. The board measures approximately 2.0x2.0 inches, without connectors.

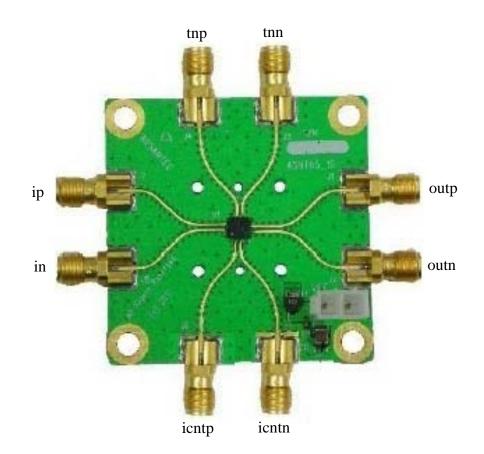

Fig. 1. Layout of ASNT05_12 PCB

The signal and power connectors are described in Table 1 and Table 2 below.

Table 1. Signal Connectors

Name on PCB	Name on Chip	Signal description	Signal polarity	I/O type
J7	ip	Differential inputs with internal SE 500hm termination to	Direct	CML
J8	in	VCC	Inverted	input
J1	outp	Differential outputs with internal SE 500hm termination	Direct	CML
J2	outn	to VCC; require external SE 50 <i>Ohm</i> termination to VCC	Inverted	output
J6	icntp	Differential control input with internal SE 1000hm	Direct	DC
J5	icntn	terminations to VCC	Inverted	voltage
J4	tnp	Differential control input with internal SE 500hm	Direct	DC
J3	tnn	terminations to VCC	Inverted	voltage

Name on PCB	Name on Chip	Supply type	Supply voltage, V
GND	vcc	External ground	0
VEE	vee	Main negative power supply	-3.3

Initial Setup and Basic Functionality

- 1. The part is static sensitive. <u>Please observe anti-static protection procedures!</u>
- 2. Measure the resistance of all connector pins to VCC, including the power supply, while making sure the board is grounded. All high speed I/O ports should measure 50*Ohms* while on the power supply connector, VEE should be high impedance and GND should be a short. icntp/icntn should measure 100*Ohms* while tnp/tnn should measure 50*Ohms*. Fig. 2 shows the resistance values of the described I/O connectors.

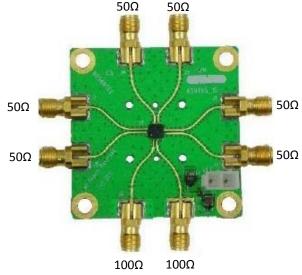

Fig. 2. Impedance of I/O Connectors

- 3. Switch on the first external power supply unit and set it to a negative supply voltage with a value of 0.0V (positive output pin of the unit must be shorted to ground).
- 4. Connect the supply unit's output pins to the PCB's Molex connector marked VEE GND so that the negative output pin is connected to VEE connector pin.
- 5. Gradually increase the negative supply voltage to -3.3*V*.
- 6. Monitor the supply current in accordance with the part's specifications. Current should be approximately 150mA.
- 7. Apply differential or SE high-speed data or clock signal to connectors J7/J8. DC blocks or the appropriate shift of voltage levels are required!
- 8. Observe a high-speed delayed clock signal at connectors J1/J2. Connect them to a sampling oscilloscope (or similar devices with a 50*Ohm* termination to ground) either directly or through DC blocks.
- 9. Apply DC voltages within the range from vcc to vcc-0.6V to connectors J6/J5 to modify the delay value. Observe the corresponding signal shifts on the oscilloscope.
- 10. Apply DC voltages within the range from vcc to vcc-0.5V to connectors J4/J3 to modify the output amplitude. Observe the corresponding output amplitude changes on the oscilloscope.

ASNT5173-PQC on ASNT05_11 Evaluation Board DC-17*Gbps*/13*GHz* Signal Phase Shifter with Amplitude Control Application Note

Part Description

The ASNT5173-PQC phase shifter accepts a data or clock signal at its differential input port ip/in and delivers the signal's copy with a controlled phase delay to its differential output port outp/outn. The delay can be adjusted by DC or AC signals applied to the differential tuning port icntp/icntn. The output amplitude can be adjusted by DC signals applied to the differential tuning port tnp/tnn.

The part is mounted on an ASNT05_11 evaluation board with 50*Ohm* transmission lines to transfer signals from the chip to 4 high-speed edge-mount female connectors (Southwest or similar) as shown in Fig. 4. The board has four low-speed edge-mount SMA connectors for control signals, a MOLEX connector for the power supply, as well as signal filters, supply filters, and decoupling networks. The board measures approximately 2.0x2.0 inches, without connectors.
